

Dear Legislator,

PLEASE CONSIDER THIS EVIDENCE: Right to Happiness (4 pages + endnotes)

**We urge you to oppose the “conversion therapy” ban bill.**

**(1) The Supreme Court of the United States said professional therapists have the same right to freedom of speech as everyone else. It abrogated decisions of the 9th and 3rd Circuit Courts that have been erroneously referenced to claim therapy bans are constitutional.<sup>1</sup> The 11th Circuit Court overturned therapy bans in its jurisdiction.<sup>2</sup>**

**(2) A view that unwanted sexual attraction or unwanted incongruent gender identity cannot safely or effectively decrease or change through standard therapies is generally based on two premises: (1) A claim that research shows therapy conversations that support people in exploring their potential for change are harmful. (2) A scientifically abandoned view that same sex attraction (orientation) and gender identity are inborn and unchangeable—they are who a person biologically is, like sex or skin color. If true, any attempt to change them would be doomed to failure and might shame and harm people if they did not change. We will now show that research contradicts these premises.**

**(3) Research examples of safe and effective therapy and faith-based support:**

- **Bans will criminalize LGB-affirmative therapists for saving lives.** LGB affirmative researchers demonstrated in **several replicated, randomized, controlled trials** that men can lastingly decrease casual sex with men through standard therapies to reduce HIV transmission risk and protect health.<sup>3</sup> Some bans forbid LGB identified people to choose help to decrease sexual behaviors. It is harmful and absurd to criminalize saving lives.
- **A two-year, prospective, longitudinal study found that men significantly decreased same sex attraction expressions, significantly increased opposite sex attraction expressions, and significantly changed sexual attraction identity in the heterosexual direction. Well-being significantly and clinically improved with a strong effect.<sup>4</sup>**
- **In another study, sex, sexual ideation, desire for same-sex intimacy, and kissing decreased toward the same sex and increased toward the opposite sex. More than two-thirds (69%) of men decreased same-sex attraction. Many were married (41%), nearly all with children—on average 3 children each. The number of married men engaging in same-sex behavior before therapy was 71% and plunged to 14% after therapy. What this means to these men, their wives, and their children can hardly be expressed. For them and the participants overall, depression and suicidality significantly decreased, and self esteem significantly increased.** Psychological benefits greatly outweighed any harms. (professional therapy and/or faith-based care; convenience sample; 88% religious)<sup>5</sup>
- **A majority of people in faith-based ministries (53%) substantially decreased or changed their same-sex attraction, and psychosocial functioning only improved, as documented by a rigorous “naturalistic, quasi-experimental, longitudinal study”.<sup>6</sup>**
- **Comprehensive research reviews by gay-affirming<sup>7</sup> and change-affirming<sup>8</sup> researchers both accept that research participants report they changed same-sex attraction and behavior through non-aversive, standard therapies. These reviews agree**

**there is no research that meets scientific standards that proves non-aversive, change-exploring therapy is unsafe or ineffective.**

**(4) Change-exploring therapy actually reduces suicidality for both minors and adults who do *not* successfully change same sex attraction through therapy, and dramatically—17 to 25 times lower—for adults, according to a replicated study. But Blossnich and colleagues hid this.** This research used a US nationally representative set of data created by gay-affirming researchers of LGB participants' suicidal thoughts, plans, intent, or attempts both before and after change therapy. Blossnich et al. (2020) intentionally used only the after therapy suicidality rates, then claimed therapy caused them. But Sullins (2021) replicated the study using both the before and after therapy suicidality rates and found, “Most of the suicidality did not follow change-exploring therapy in time but preceded it.” Unsurprisingly, people who were suicidal got therapy more than people who were not suicidal. They decreased their suicidality.

- **Harm-claiming studies regularly make this mistake: Blaming therapy for depression and suicidal symptoms that preceded it is like saying people who have had anti-depressant medication have had more depression and suicidality than people who have not sought anti-depressants. Therefore anti-depressants cause depression and suicidality and should be banned. This is blaming the cure, a tragic, misguided mistake that will bring about the very harm activists aim to prevent.<sup>9</sup> This kind of mistake is a violation of the principle of the scientific method that a cause must precede an effect in time, and it is well-known to be research malpractice. But it is a common ploy.**
- **Activists in professional organizations use this kind of dishonest research to guide their boards to make position statements about change-exploring therapy.** The American Psychological Assoc. says it bases its statement on Blossnich and colleagues and other studies like it<sup>10 11 12 13 14 15 16 17</sup> Many organizations follow the APA.
- **Therapy ban bills base themselves on this dishonest research and on these organization position statements based on the same dishonest research.**

**(5) An American Psychological Association task force (2009): (i) Said aversive methods have not been used for 40-50 years.<sup>18</sup> (ii) Said it based its recommendations on one-sided, anecdotal, not scientific, evidence.<sup>19</sup> (iii) Said it based its recommendations on “key findings in the research” that same-sex attraction does not change through life experiences<sup>20</sup> that is now reversed by the *APA Handbook of Sexuality and Psychology* (2014).<sup>21</sup>**

**(6) Many professional organizations world-wide affirm change-exploring therapy.<sup>22</sup> Opposing professional guild opinions are not a consensus or scientific evidence.<sup>23</sup> Several organizations<sup>24</sup> and governments<sup>25</sup> find the “best available” research for medical gender affirmation is very poor. Many UN nations reject the mandate and therapy-opposing report of an individual “expert”;<sup>26</sup> no UN binding agreement mentions sexual orientation or gender identity. There is no professional consensus against change therapy.**

**(7) They can change.**

- The *APA Handbook of Sexuality and Psychology* and robust research internationally have established that same-sex attraction, romantic partnerships, behavior, and identity all commonly shift or change for adolescents and adults, men and women.<sup>27 28 29</sup>
- Gender dysphoria overwhelmingly resolves for children—85-90%<sup>30</sup> and changes lifelong.<sup>31</sup>
- But living as the opposite sex<sup>32</sup> and puberty blockers<sup>33</sup> stop natural resolution in children.

**(8) Same-sex sexuality and gender incongruence are not biologically determined.**

A gene study, by more than 20 researchers in 7 nations, of nearly half a million people found same-sex behavior is **influenced largely by life experience**.<sup>34</sup>

A global consensus statement of endocrine societies worldwide says there is **no consistent evidence brains are different for gender incongruent or congruent people**.

Masculine and feminine aspects of the brain mostly develop gradually from life experiences.

Gender identity develops from a complex interaction of “biopsychosocial” influences<sup>35 36</sup>

<sup>37</sup>—**like other unchosen, complex traits therapists help people decrease/change.**

**(9) The American Psychological Association’s *APA Handbook of Sexuality and Psychology*<sup>38</sup> and research say family factors<sup>39 40 41</sup> and childhood sexual abuse<sup>42</sup> may be causal factors** in having same-sex partners for some, and family pathology<sup>43 44 45</sup> may be one cause for transgender identity. Some clients want to explore these causes and heal. There is no reason why this therapy should be less safe or effective than any other therapy.

**(10) International research and professional organizations say psychiatric disorders and suicidality usually EXIST BEFORE gender incongruence and may cause it.**<sup>46</sup>

- **An 8 year study of 8.8 million people found 71% to 75% of gender incongruent adolescents (ages 10 to 17) had psychiatric disorders in their lifetime (similar rates in many countries<sup>47</sup>) BEFORE gender incongruence (also found in Finland<sup>48</sup>), compared to 3% to 4% of sex accepting peers. In the 6 months BEFORE first medical evidence of gender incongruence, depression was 23 to 24 times higher than for gender congruent peers, suicidal ideation 45 to 54 times higher, and self-injuring behavior 70 to 144 times higher.**<sup>49</sup>
- **Finland’s research<sup>50 51</sup> and “Recommendation” say disorders and suicidality may predispose to gender dysphoria<sup>52</sup> in agreement with the World Professional Assoc. for Transgender Health,<sup>53</sup> American Psychiatric Assoc.,<sup>54</sup> and British Psychological Society.<sup>55</sup>**
- **Psychiatric disorders also cause 90% of suicides worldwide.<sup>56</sup> Treating psychiatric disorders may resolve both suicides and gender dysphoria.**
- **Activists appear unaware that these conditions do not come after therapy but before it, therefore change-exploring therapy does not cause them.**

**(11) Cross sex hormones and surgeries *sterilize children*, reduce sexual pleasure<sup>57</sup>, and lead to 2-2.5 times higher rates of deaths from cancers, strokes, and heart attacks, 19 times more completed suicides. Long term, it is *not* transgender health and is *not* suicide prevention. Psychiatric hospitalizations still persist at a nearly 3 times higher rate<sup>58 59 60 61</sup>.**

- **Under therapy bans, youths who regret transition cannot be helped to embrace their body sex.**
- **Gender services in some countries that have the longest experience with research and treating gender dysphoria are strongly going in the direction of restricting medical affirmative treatments for minors—Finland and Sweden.**<sup>62 63</sup>

**(12) Finland’s gender dysphoria treatment “Recommendation” for minors says “first-line treatment” should aim to reduce or resolve gender dysphoria by aiming to reduce or resolve predisposing disorders, and not changing bodies.<sup>64</sup> This is exactly what change-exploring therapy does and bans would criminalize. Yet therapy ban activists are promoting medical interventions for gender incongruence and criminalizing therapy that treats underlying disorders. This is a disaster.**

### **(13) Replacing change exploring therapy with affirmative treatment has not helped.**

- In the Netherlands and Sweden, nearly half a century of progressively increasing affirmation and treatments for **gender incongruent** people has resulted in little to no change in their higher suicide rates and mental disorders<sup>65 66 67 68 69</sup>. Parent support does not help.<sup>70</sup>
  - During 50 years of progressively and dramatically increasing societal affirmation of **LGB** identity, affirmative therapy, and discouragement of any change therapy that treats potential underlying sexual or gender trauma, LGB psychological stress has progressively worsened according to the originator of the minority stress theory and colleagues.<sup>71</sup>
  - ***Exactly what therapy bans require—increasing affirmative treatments and criminalizing treatments for underlying disorders or trauma—has not decreased suicides.***
- Therapy ban activists are misguiding lawmakers to take exactly the wrong direction.**

**(14) Common reasons people want change-exploring therapy are: (1) They found living as LGBT unfulfilling. (2) They feel their LGBT feelings were caused by sexual or gender trauma. They want the right to heal. (3) They want to reduce risky sexual or gender behavior and the desire to engage in it.** Risky behavior may include behavior that is unhealthy, unsafe to self, others, one’s marriage, or family, unlawful, unfulfilling, a symptom of trauma or a psychiatric disorder, or undesirable for whatever reason a person chooses. People should have the right to therapeutic help to reduce or change these behaviors and the desire to engage in them without requiring government approval of their reasons, and regardless of whether they are directed toward the *opposite* sex or the *same* sex, or are gender *congruent* or gender *incongruent*, *without discrimination*. **(4) They want to live according to their faith that should be respected.** Robust research<sup>72 73</sup> and studies by a team of LGBT-affirming and change-affirming researchers show that LGBT people who **live according to their traditional faith** are no less happy, mentally healthy, satisfied with life, and flourishing than those of liberal faith or no faith.<sup>74</sup> Harm studies generally exclude them. They find change therapy substantially more helpful. A cultural change in ideology is not required. **(5) They aspire to be in—and want to reduce same sex attraction to be faithful in—an opposite sex marriage.** For some, incongruent gender identity or expression is putting their marriage and family at risk. The *APA Handbook of Sexuality and Psychology* says, “contrary to the conventional wisdom,” most people who are same sex attracted are both sex attracted. They are “the norm,” and exclusive same sex attraction is “the exception.”<sup>75</sup> Research says their relationships are mostly opposite sex<sup>76</sup> and satisfying.<sup>77</sup>

**Change-allowing therapy helps to keep LGBT individuals and families safe.**

**(15) Government should not decide who someone is, what will make a person happy, and who may have access to family or life saving conversations. Everyone should have the right to walk away from sexual or gender practices and experiences that do not work for them and have help to live a life that brings health and happiness.**

**We urge you to vote “NO” on a “conversion therapy” ban bill.**

Respectfully submitted,  
National Task Force for Therapy Equality

### Endnotes

<sup>1</sup>National Institute of Family and Life Advocates v. Becerra, 138 S.Ct. 2361, 2018, p. 14.

More on legal decisions related to therapy regarding sexual orientation and gender identity:

1. The Supreme Court of the United States (SCOTUS) rendered a decision (National Institute of Family and Life Advocates v. Becerra, 2018) that professional speech has the same right to freedom of speech as any other speech. SCOTUS said it has never accepted a doctrine that professional speech is professional conduct and therefore can be censored. Otherwise, all the government would need to do to take away first amendment rights from a group of people would be to license them.
2. This decision specifically abrogated previous decisions in the 9th (Pickup et al. v. Brown, 2013) and 3rd (King v. Governor of the State of New Jersey, 2014) Circuit Courts of Appeals that had previously been used to argue to legislators that therapy bans are Constitutional. It is often reported that SCOTUS declined appeals to hear these decisions in 2013 and omitted that SCOTUS abrogated them in 2018.
3. A decision of the US 11th Circuit Court of Appeals struck down conversion therapy ban laws (Otto et al. v. City of Boca Raton et al, 2020) based in part on the SCOTUS decision (NIFLA v Becerra, 2018).
4. The Council of Europe, which also includes all EU Member States, guarantees freedom of speech and freedom of religion, the latter of which includes the right to hold, share, and manifest religious beliefs and faith.
5. A United Kingdom High Court in Bell vs. Tavistock (Dec. 12, 2020) ruled that medical gender affirming treatment in minors was experimental and could not, in most cases, be given to minors under 16 without court order, and that such was advisable for those 16-17. They added, “There is no age appropriate way to explain to many of these children what losing their fertility or full sexual function may mean to them in later years.” (Bell et al. v. GIDS, UK, 2020, <https://www.judiciary.uk/wp-content/uploads/2020/12/Bell-v-Tavistock-Judgment.pdf> )

## Oppose “Conversion Therapy” Ban Bill

### **<sup>3</sup> Therapy bans criminalize gay-affirmative therapists and discriminate against LGB marriages if they prohibit support to decrease unwanted same sex behaviors.**

Gay affirmative researchers have published in peer-reviewed journals several articles of replicated, randomized, controlled trials showing men who have sex with men significantly reduced casual same sex behavior they did not want through standard therapies conducted by gay affirmative therapists and through gay peer counselors and maintained the change at 6 month, 8 month, and 1 year follow up evaluations. Over these studies taken together, men from a wide range of levels of education and income were successful. In the largest and most recent of these studies (Nyamathi et al., 2017), men who had children and men for whom same sex behavior was inconsistent with their values (high “homonegativity”) were particularly successful in reducing unwanted casual same sex behavior. The researchers’ purpose for these interventions was to reduce drug use and risky same sex behavior in order to decrease risk of HIV transmission. (Nyamathi 2017; Roeback 2014; Shoptaw 2008; 2005)

Perhaps these particularly successful men wanted help to be faithful to the wife they love more easily, in order to keep their marriage and family together, or wanted to live according to the religious faith of their heart—two of the most common reasons people seek change-exploring therapy. Under a therapy ban, gay-affirmative therapists would be punished for providing potentially life saving therapy, and there would be marriages and families of sexual minorities that cannot be saved.

A separate study of 125 men who experienced therapy that is open to exploring capacity to change same sex attraction and behavior found that 41% were married, most of them with children—3 children each on average. Also, 88% of participants attended religious services at least once per week. For the men in this convenience sample, same sex behavior plummeted from 71% before therapy to 14% after therapy, and 69% decreased same sex attraction. Sexual behavior, ideation, desire for intimacy, and kissing changed significantly from homosexual and to heterosexual. What this means to these men, their wives, and their children can hardly be expressed in words. In addition, 61% increased self esteem, 73% decreased depression, and 22% decreased suicidality. <sup>9</sup> Sullins found that change-exploring interventions actually decrease suicidality for people who did not change sexual attraction through mental health professional therapy or care from a religious leader. He studied a nationally representative sample of 1,518 people who identify as LGB, therefore who presumably did not change sexual attraction through such interventions. Therefore, the generalization can legitimately be made that professional and religious counseling reduces suicidality for minors and adults and dramatically reduces suicidality—by 17 to 25 times—for adults who identify as LGB and therefore presumably did not change sexual attraction or identity through these efforts. Expressed another way, a generalization claiming harm for people who do not change is not supported and is invalid.

Sullins, D. (2021). Sexual orientation change efforts (SOCE) reduce suicide: Correcting a false research narrative.

### <sup>10</sup> Recipe for Deceptive Harm Claiming Research

- Do not define “conversion therapy” or mischaracterize what we do.
- Use only LGBT-identified participants—people who by definition did not change. People who changed are not permitted to participate.  
Psychologist/Researcher Dr. Christopher Rosik:  
Like surveying divorcees to find out if marriage counseling is safe or effective.
- Biased Qs: Example: Did someone try to *make you* change? Assumes coercion.
- Mix professional therapy with pastoral caregiving, parent “conversion therapy,” or more. “Conversion therapy” could mean someone asked their pastor to pray with them once, a parent encouraged a child to wait until age 18 to become sexually active or to decide about permanently changing their body, or a physician told them the benefits and also the harms of gender medical interventions. We do not know what was studied.
- Ask participants only if they are depressed or suicidal now (after therapy), and not if they were before therapy. Then assume therapy caused how they are presently. These symptoms could have been higher before therapy and decreased after therapy. Like saying people who have had anti-depressants are more depressed and suicidal than people who have not sought or had anti-depressants. Therefore anti-depressants cause depression and suicidal thoughts and should be banned. Banning the cure.
- Do not compare “conversion therapy” to “any therapy in general” or “affirmative therapy”. It is likely, if not probable, that people who go to any therapy—including affirmative therapy or change-exploring therapy—have more suicidality than people who do not go to therapy.

Example: Blosnich et al (2020) made all these mistakes except they did define “sexual orientation change efforts”.

Blosnich, J., Henderson, E, Coulter, R, Boldbach, J., & Meyer, I. (2020). Sexual orientation change efforts, adverse childhood experiences, and suicide ideation and attempt among sexual minority adults, United States, 2016-2018. *American Journal of Public Health Surveillance*, 110(7), 1024-1030. <https://pubmed.ncbi.nlm.nih.gov/32437277/> )

## Oppose “Conversion Therapy” Ban Bill

---

<sup>13</sup> The Williams Institute (Mallory et al. 2018) estimated that slightly less than 700,000 LGBT-identified adults ages 18 to 59 received “conversion therapy” at some time in their life, about half of them at or before age 18. The Institute did not, however, use data it had available to discover whether “conversion therapy” was harmful for LGB-identified survey respondents. Instead, the Williams Institute led readers to assume “conversion therapy” was harmful. Sullins (2021) did use this available data and found “conversion therapy” decreased suicidality for minors and adults, and dramatically for adults.

The Institute based its estimate on a representative survey of LGB identified adults and a non-representative survey of TGNC identified adults. The surveys asked whether a professional (psychologist or counselor) or religious leader (pastor or priest, advisor, or counselor) tried to “make” them change their sexual orientation or gender identity. The Williams Institute took the figures from these surveys and applied them to various data sets of the US population to arrive at their estimate.

The Generations Study of LGB-identified adults did collect sufficient evidence to answer the question of whether there was a difference in rates of suicidal thoughts, plans, intentions, or attempts before and after “conversion therapy” to help answer the question of whether “conversion therapy” was harmful, but the Institute intentionally did not use it. The researchers just left the reader to assume the interventions were harmful. Blossnich used only the after therapy data and simply assumed the therapy caused those figures. Sullins compared suicidality symptoms from both and after “conversion therapy”, as is necessary to answer the question, and found “conversion therapy” significantly decreased suicidality for minors and adults, especially dramatically for adults—by 17 to 25 times lower.

Since the Generations Study data was solely on adults who currently identify as LGB, it excluded former LGB-identified adults. If former LGB-identified adults had been permitted to participate, the benefit of “conversion therapy” likely would have been greater. Given that the Generations Study is based on a nationally representative survey of LGB-identified adults, that is, adults who did not change sexual attraction through “conversion therapy,” the generalization can legitimately be drawn that LGB-identified minors and adults who do not change through “conversion therapy” do not as a result become more suicidal but rather less suicidal. Therapy has many benefits. “Conversion therapy” for minors and adults is safe and beneficial.

## Oppose “Conversion Therapy” Ban Bill

<sup>14</sup> An article by McGeorge et al. (2013) erroneously assumes that knowledge and skills for one subgroup of people who have same sex attraction or behavior applies to all subgroups. This is a common mistake. These authors lack knowledge and skill for treating those who reject an LGB identity. The non-LGB-identified are quite different, and they require quite different treatment and research questions and measures. McGeorge and co-authors shine a light on the great need for ideologically diverse research teams to help researchers see their lack of knowledge and skill regarding **different subgroups** among people who have diverse experiences of sexuality. This work has recently begun, with very helpful findings coming forth.

See following footnote on “**Non-LGB-identified (versus LGB-identified)**” subgroups among individuals who have diverse experiences of sexuality.

It is likely that clients and therapists who have knowledge and skill for one subgroup regard clients in the other subgroup with skepticism or disbelief in their identity and regard therapists who share the worldview of the other subgroup as not having the right knowledge and skills.

McGeorge, C., Carlson, R., & Toomey. (2013). An exploration of family therapists’ beliefs about the ethics of conversion therapy: The influence of Negative beliefs and clinical competence with lesbian, gay, and bisexual clients. *Journal of Marital and Family Therapy*. <https://doi.org/10.1111/jmft.12040>

<sup>15</sup> **Research on change-oriented therapy is being done in silos of subgroups.**

### **Non-LGB-identified (versus LGB-identified):**

- **Conservative, orthodox religious beliefs** (p. 22)  
Versus belief in biological origin for same-sex attraction (p. 20)
- **Prioritize religious identity** over sexual feelings (p. 22)
- Greater religious participation/weekly attendance at services (p. 22)
- **Religion and spirituality significantly and positively linked to health (but close to no link for LGBT-identified)** (p. 28)
- Likely get community support from religious community (versus from LGB community)
- **No less healthy than LGB-identified, contrary to the minority stress theory that identifies religion as a source of sexual minority stress** (p. 24)
- Primacy on chastity or heterosexual relationship (p. 22)
- **Report nearly all change-oriented therapy goals as substantially more helpful** (versus harmful) (p. 27)

**These findings come from research conducted by an ideologically diverse research team of LGBT-affirming and change-affirming researchers.**

<sup>16</sup> Wright, T., et al. (2018). Conversion Therapies and Access to Transition-Related Healthcare in Transgender People. A Narrative Systematic Review. *BMJ Open* 2018;8:e022425. doi:10.1136/bmjopen-2018-022425

In this research review, the authors identify a gap in research on treatment of gender dysphoria for both medical gender interventions and change-exploring therapy. The authors found only 4 case studies on change-exploring therapy and 3 on medical gender interventions that met certain standards and were published between 1990 and 2017. If accurate, this finding would be a basis for concluding therapy bans that censor change-allowing therapy and support gender medical treatment have had no basis in science. Yet the authors state with certitude, “What is known, however, is that TGD affirmative practices are associated with positive mental health outcomes.” (p. 11) They base this on a single reference to a pilot study of the vanishingly small number of 8 participants with only a 3-month follow-up, during which time depression was decreased and there was no significant difference in coping. The authors demonstrate a breath-taking double standard when they accept this mere pilot study that supports their preferred conclusions as conclusive but considers the other studies to constitute a gap in research. Then, they assert that, in the case of change-exploring therapy, a gap in evidence is to be taken as actual evidence that this therapy is unsafe and ineffective, but regarding the gap in evidence for gender medical interventions, they draw no such conclusion. Asserting that a gap in evidence is evidence violates fundamental principles of the scientific method, and applying their reasoning inconsistently for these different treatment approaches openly declares their bias.

The authors also rely heavily on Newhook and colleagues as having settled the erasing of all the research showing childhood gender dysphoria overwhelmingly resolves through life experience. The same year as this Wright et al., 2018 review was published, Zucker soundly critiqued that attempt at erasure.

The authors ignored research available to them that actually did meet scientific standards—prospective, longitudinal research of a national cohort—that showed psychiatric problems and suicides persisted at higher rates for decades following hormone and surgery interventions (Sweden: Dhejne et al., 2011). A follow up review by Dhejne et al. (2016) had no studies long enough to give endpoint outcomes nor that retained participants sufficiently to draw conclusions. (More critique in another footnote.) More recent studies at university gender clinics (The Netherlands: Wiepjes, et al., 2020; de Blok et al., 2021) and an entire population study (Sweden: Branstrom & Pachankis, 2020) only underscore that hormones and surgeries do not resolve disorders or suicidality.

The authors reported aversive behavior therapy, that was sometimes used for behavior therapy, the dominant mainstream form of therapy in the 1960s and 1970s, was not effective for resolving gender dysphoria (p. 10). It has largely been abandoned.

The authors appear not to have sufficiently considered research in one of Finland’s two gender clinics (Kaltiala-Heino et al., 2015) and in a cohort in the United States (Becerra-Culqui et al., 2018) showing high rates of psychiatric disorders commonly if not usually precede evidence of onset to gender dysphoria in adolescents, therefore may cause it,

Today, Finland’s “Recommendation” (COHERE, 2020), in line with Finland’s research, says firstline treatment for gender dysphoria should include treating psychiatric disorders that may predispose to gender dysphoria, exactly what contemporary change-exploring therapy does and therapy bans criminalize. This is a disaster.

---

<sup>19</sup>APA Task Force (2009).

No causal evidence of harm: pp. 42, 82-91. Reported research participants (from over a century of research) reported they changed sexual attraction or behavior, and some (from a small number of studies) said they were harmed: pp. 49, 85. No studies reporting harm met task force scientific standards: p. 42. The APA task force used the reports of harm as anecdotal evidence and based its recommendations on them. The researchers said one of the “key” “findings in the research” on which it “built” its “conclusions” and “recommendations” was that sexual attraction does not change through life experience: pp. 63, 86. If that were true, sexual attraction could not change through therapy. The *APA Handbook of Sexuality and Psychology* concluded 5 years later, however, that research had established that same-sex attraction, fantasies, behavior, and orientation identity all commonly change through life experience for men and women, adolescents and adults (2014, vol. 1, pp. 636, 562, 619).

<sup>20</sup> APA Task Force (2009), p. 86.

<sup>21</sup> Sexual orientation changes over the life span.

American Psychological Association’s *APA Handbook of Sexuality and Psychology* (2014):

- “[R]esearch on sexual minorities has long documented that many recall having undergone notable shifts in their patterns of sexual attractions, behaviors, or [orientation] identities over time.”

(Diamond, 2014, in *APA Handbook*, v. 1, p. 636)

- “Although change in adolescence and emerging adulthood is understandable, change in adulthood contradicts the prevailing view of consistency in sexual orientation.”

(Rosario & Schrimshaw, 2014, *APA Handbook*, v. 1, p. 562)

- “Over the course of life, individuals experience the following:...changes or fluctuations in sexual attractions, behaviors, and romantic partnerships.”

(Mustanski, Kuper, & Greene, 2014, in *APA Handbook*, v. 1, p. 619.)

<sup>23</sup> Excerpt from the 11th Circuit Court decision (repeated from previous footnote):

Defendants say that the ordinances “safeguard the physical and psychological well-being of minors.” Together with their amici, they present a series of reports and studies setting out harms. But when examined closely, these documents offer assertions rather than evidence, at least regarding the effects of purely speech-based SOCE. Indeed, a report from the American Psychological Association, relied on by the defendants, concedes that “nonaversive and recent approaches to SOCE have not been rigorously evaluated.” In fact, it found a “complete lack” of “rigorous recent prospective research” on SOCE. As for speech-based SOCE, the report notes that recent research indicates that those who have participated have mixed views: “there are individuals who perceive they have been harmed and others who perceive they have been benefited from nonaversive SOCE.” What’s more, because of this “complete lack” of rigorous recent research, the report concludes that it has “no clear indication of the prevalence of harmful outcomes among people who have undergone” SOCE. We fail to see how, even completely crediting the report, such equivocal conclusions can satisfy strict scrutiny and overcome the strong presumption against content-based limitations on speech.

Still, they say, our confidence should not be shaken: the “relative lack of empirical studies on SOCE is not evidence of lack of harm....If anything, the lack of studies on SOCE may be indicative of the risk of harm.” The district court agreed: “Requiring Defendants to produce specific evidence that engaging in SOCE through talk therapy is as harmful as aversive techniques would likely be futile when so many professional organizations have declared their opposition to SOCE.” **In other words, evidence is not necessary when the relevant professional organization are united.**

But that is, really, just another way of arguing that majority preference can justify a speech restriction. The “point of the First Amendment,” however, “is that majority preferences must be expressed in some fashion other than silencing speech on the basis of its content.” Strict scrutiny cannot be satisfied by professional societies’ opposition to speech. **Although we have no reason to doubt that these groups are composed of educated men and women acting in good faith, their institutional positions cannot define the boundaries of constitutional rights. They may hit the right mark—but they may also miss it.**

**Sometimes by a wide margin too. It is not uncommon for professional organizations to do an about-face in response to new evidence or new attitudes....**

<sup>24</sup> MULTIPLE MEDICAL GROUPS THROUGHOUT THE WORLD have warned against “gender affirmative” interventions, including the:

- [Royal College of General Practitioners](#)
- [Swedish Pediatric Society](#)
- [Royal Australian College of Physicians](#)
- [National Association of Practicing Psychiatrists \(Australia\)](#)
- [Society for Evidence Based Gender Medicine \(international\)](#)
- [Pediatric and Adolescent Gender Dysphoria Working Group \(international\)](#)

The Royal College of Psychiatrists has refused a position statement that would oppose psychotherapy or psychiatric treatment to resolve gender dysphoria.

## Oppose “Conversion Therapy” Ban Bill

<sup>25</sup> **Therapy bans prohibit therapy conversations. Instead, they promote medical body altering interventions.**

**WHAT IS THE QUALITY OF THE “BEST AVAILABLE RESEARCH” THAT IS USED TO CLAIM MEDICAL GENDER AFFIRMATIVE PUBERTY BLOCKERS, CROSS SEX HORMONES, AND SURGERIES ARE “EVIDENCE BASED” INTERVENTIONS BASED ON “THE BEST AVAILABLE EVIDENCE”?**

The Endocrine Society Guideline with its 6 co-sponsoring organizations, including the World Professional Association for Transgender Health, say nearly all their recommendations are based on low, very low, and no research.

National forerunners in gender affirming interventions—Finland and Sweden—are strongly moving away from medical gender interventions due to lack of research or very low quality of research. Finland recommends against these medical interventions, and Swedish clinics are placing severe restrictions on them.

A UK government review found the research quality to be “very low certainty evidence.” A US government research review found research evidence to be “inconclusive”.

<sup>28</sup> Two-thirds of minors questioning their sexual orientation resolve to heterosexual.

“In addition, we found that, of those who described themselves as “unsure” of their orientation identity at any point, 66% identified as completely heterosexual at other reports and never went on to describe themselves as a sexual minority.” (Abstract)

Ott, M. Corliss, H., Wypij, D., Rosario, M., Austin, B. (2011) Stability and change in self-reported sexual orientation in young people: Application of mobility metrics. *Archives of Sexual Behavior*, 40: 519–532. doi:10.1007/s10508-010-9691-3; Author manuscript available in PMC 2012, June 1.

<sup>29</sup> Of all men who experienced same-sex behavior, 42% did so before age 18 and never again.

## Oppose “Conversion Therapy” Ban Bill

<sup>33</sup> Once children are given puberty blockers that prevent them from experiencing hormones natural to their sex, virtually all go on to be given cross sex hormones and be sterilized for life. If left alone, 75% to 98% of children resolve their gender dysphoria spontaneously through life experience or through experiencing the hormones natural to their sex. Puberty blockers are not a “pause button” but rather the “entry drug” that locks them in to going on to cross sex hormones.

2% stopped puberty blockers. 98% went on to cross sex hormones and being sterilized. There was no psychological improvement with puberty blockers, even with psychological support.

Carmichael, P., Butler, G., Masic, U., Cole, T.J., De Stavola, B.L., Davidson, S., et al. (2021) Short-term outcomes of pubertal suppression in a selected cohort of 12 to 15 year old young people with persistent gender dysphoria in the UK. *PLoS ONE* 16(2): e0243894. <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0243894>

None stopped puberty blockers. 100% went on to be cross sex hormones and being sterilized.

de Vries, A.L.C., Steensma, T.D., Doreleijers, T.A.H., & Cohen-Kettenis, T.C. (2011). Puberty suppression in adolescents with gender identity disorder: A prospective follow-up study. *Journal of Sexual Medicine*, 8(8), 2276-83. <https://pubmed.ncbi.nlm.nih.gov/20646177/>

6% stopped puberty blockers, some due to adverse side effects, and 3.5% because they no longer wanted to change their bodies. 94% went on to cross sex hormones and being sterilized.

<sup>35</sup> Gender incongruence is not caused by having the brain of the opposite sex.

The Global DSD Consortium Consensus Statement Update 2016 (a highly respected consensus statement of endocrine societies around the world) says,

- No consistent evidence that brain structures are different for gender *incongruent* people and gender *congruent* people.
- Masculine or feminine aspects of the brain largely develop “gradually” (after birth),
- In interaction with *psychological*, social, and cultural experiences in the environment.

(European Society for Paediatric Endocrinology, Paediatric Endocrine Society, Asian Pacific Paediatric Endocrine Society, Japanese Society of Paediatric Endocrinology, Sociedad Latino-Americana de Endocrinología Paediatrica, Chinese Society of Paediatric Endocrinology and Metabolism. (Lee et al., 2016))

<sup>36</sup> (Repeats another footnote.)

At least 14 professional organizations agree, transgender identity has social environment causes. It is not simply biologically caused by genes, hormones, or brain structures.

### Quotes and Summaries of Statements

The Endocrine Society and 6 organizations that co-sponsored its Guideline: the American Association of Clinical Endocrinologists, American Society of Andrology, European Society for Pediatric Endocrinology, European Society of Endocrinology, Pediatric Endocrine Society, World Professional Association for Transgender Health:

“Results of studies from a variety of biomedical disciplines—genetic, endocrine, and neuroanatomic—support the concept that gender identity and/or gender expression likely reflect a complex interplay of biological, environmental, and cultural factors.” Endocrine Society Guideline (2017), pp. 6-7.

Hembree, W. et al. (2017). Endocrine treatment of gender-dysphoric/gender-incongruent persons: An Endocrine Society clinical practice guideline. *Journal of Clinical Endocrinology and Metabolism*, 102, 1–35. <https://doi.org/10.1210/jc.2017-01658>

<sup>37</sup> Identical twins share the same genes and biological environment in the womb before birth. This means they share potential or hypothesized biological influences on sexual attraction or gender identity or expression—such as genes, epigenetics, prenatal hormones, prenatal maternal factors, and number of older brothers (hypothesized by some to influence prenatal factors). Identical twins are always the same sex. Sex is biologically determined. But if one identical twin comes to have LGB experiences, incongruent gender identity, or LGB experiences *and* incongruent gender expression, the other usually does not. This shows that *nonbiological* influences—influences *other than* genes or prenatal biological environmental conditions—are predominant causal factors for LGB attraction and behavior and incongruent gender identity and expression.

Bailey et al. (2016): LGB experiences: pp. 74-76. Non conforming gender expression: pp. 46, 76.

Incongruent gender identity: Diamond, M. (2013). - LGBT youth were more likely to have grown up with household dysfunction defined by parent incarceration, problem drinking, or abuse of illegal or prescription drugs. This is included in both the household dysfunction and polyvictimization patterns.
- But not significant for Q youth, p. 3.
- LGBTQ youth were more likely to experience psychological and/or physical abuse that may have included witnessing domestic violence (p. 4) and polyvictimization that adds household dysfunction and sexual abuse.
- Gender nonconforming adolescents, especially bisexuals, had experienced more types of abuse. Transgender identity, especially for boys, was associated with more kinds of adverse experiences (household dysfunction, physical and/or sexual abuse, and polyvictimization, p. 6).
- Sexual orientation and gender identity may be generally confounded with gender nonconformity. However, this study specifically measured gender nonconformity separately and controlled for it, making it possible to discover that the association between LGBTQ youth and adverse experiences is not simply explained by gender nonconformity. pp. 6-7.
- Gender nonconforming adolescents (especially bisexual and transgender identified) had experienced more types of adverse experiences. Gender nonconformity, however, was not the only explanation for adverse experiences (p. 7). It is possible that greater adverse childhood experiences led to both gender nonconformity and LGBTQ identity.

<sup>41</sup> Absence of a parent, especially the parent of the same-sex as the child, is a small but statistically significant and potentially causal factor found internationally for same-sex attraction, behavior, and marriage found in several large, robust, population-based, prospective, longitudinal studies below.

The first 6 years of life for both sexes and adolescence for girls may be sensitive periods (Frisch & Hviid, 2006).

<sup>42</sup> The *APA Handbook of Sexuality and Psychology* says childhood sexual abuse has “associative and potentially causal links” to ever having same sex partners. (vol. 1, pp. 609-610)

“One of the most methodologically rigorous studies in this area used a prospective longitudinal case-control design that involved following abused and matched nonabused children into adulthood 30 years later. It found that men with documented histories of childhood sexual abuse had 6.75 times greater odds than controls of reporting ever having same-sex sexual partners (H. W. Wilson & Widom, 2010). To help control for possible confounding factors, the authors conducted post hoc analyses controlling for number of lifetime sexual partners and sex work, but the association remained. The effect in women was smaller (odds ratio = 2.11) and a statistical trend ( $p = .09$ ).” (1:609)

<sup>45</sup> **Australian Hospital Gender Clinic 5 Year Study**

**“The developmental stories told by the children and their families highlighted high rates of adverse childhood experiences”.**

**Adverse Childhood Experiences (ACEs)**

**79 Children ages 8 to 15 years (2013-2018):**

- **89% Psychiatric disorders or conditions, (14% autism).**
- **98% Adverse childhood experiences (ACEs), on average 5, usually *in* the family:**
  - Family conflict
  - Loss by separation as from a parent or grandparent
  - Mother mental illness
  - Father mental illness
  - Bullying
  - Maltreatment—almost two-thirds of the children:
    - Exposure to domestic violence
    - Emotional, physical, or sexual abuse
- **Families did not think they were troubled; saw gender dysphoria as an isolated problem.**
- **Multi-specialty staff felt under pressure to abandon the holistic, biopsychosocial model of care—fearful.**
  - Risk to children. Risk of lawsuit to themselves.
  - **They could probably have added: therapy ban laws threaten them against following their best professional judgement and best practices.**

## Oppose “Conversion Therapy” Ban Bill

<sup>48</sup> In Finland, 75% of adolescents applying for medical gender affirming interventions had severe psychiatric disorders in their lifetime that commonly began before, and seldom after, they questioned their gender identity, according to their medical records.

In addition, the majority of adolescent applicants had been significantly bullied at school (57%), in nearly every case *before* they questioned their gender identity (92%) and for reasons unrelated to gender presentation or gender identity (73%). In nearly half the adolescents applying for gender services (49 percent), persistent experience of bullying *before* thoughts about gender was found to be associated with peer isolation, anxiety, depression, self-harm, and suicidal preoccupation, if not attempts. These adolescents had very high hopes that sex change procedures would solve all their social, academic, and mental health problems (Kaltiala-Heino et al., 2015, pp. 4-6). We have treatments for psychiatric disorders, neurodevelopmental disabilities, and suicidal thoughts, and we are making continual advances. Those who are promoting experimenting on children’s bodies are showing stunning disinterest in what is causing children and adolescents to reject their bodies and in offering non-invasive therapy conversation treatment.

Mental Health of Transgender and Gender Nonconforming Youth Compared With Their Peers. *Pediatrics*, 141(5): e20173845 ; <https://pubmed.ncbi.nlm.nih.gov/30476120-letter-to-the-editor-endocrine-treatment-of-gender-dysphoricgender-incongruent-persons-an-endocrine-society-clinical-practice-guideline/>

<sup>50</sup> Finland: PSYCHIATRIC DISORDERS

### Adolescent applicants for “sex reassignment” services

at one of Finland’s two national centers for these services from 2011 to 2013

- 75% had psychiatric treatment for reasons other than gender dysphoria during their lifetime. (p. 5)
- “Severe psychopathology preceding onset of gender dysphoria was common.”
- “The recorded comorbid disorders were thus severe and could seldom be considered secondary to gender dysphoria.”

(Kaltiala-Heino, R., Sumia, M., Työläjäarvi, M., and Lindberg, N. (2015). Two years of gender identity service for minors: Overrepresentation of natal girls with severe problems in adolescent development. *Child and Adolescent Psychiatry and Mental Health*, abstract, p. 6. <https://doi.org/10.1186/s13034-015-0042-y> )

## Oppose “Conversion Therapy” Ban Bill

<sup>51</sup> FINLAND: BULLYING with Mental Disorders Came *Before* Gender Incongruence  
for Adolescents Applying for “Sex Reassignment” Services (2011-2013):

- 57% had been significantly bullied at school.
  - 92% of these were bullied before gender incongruence.
  - 73% were bullied for reasons unrelated to gender presentation or gender identity.
- 49% had been persistently bullied before gender incongruence.
  - This bullying was associated with *peer isolation, anxiety, depression, self-harm, and suicidal preoccupation, if not attempts.*
  - These adolescents had “very high expectations” that gender medical procedures “would solve their problems in social, academic, occupational and mental health domains.” (pp. 4-6).

(Kaltiala-Heino et al., 2015, p. 4, “e group” on Table 2 and on p. 6). <https://doi.org/10.1186/s13034-015-0042-y> )

<sup>52</sup> Finland’s treatment “Recommendation” says, “The first-line treatment for gender dysphoria” includes treatment “of possible comorbid disorders” that may “predispose a young person to the onset of gender dysphoria.” (COHERE, 2020, chapter 7) This is exactly what therapists in the IFTCC do and trained pastoral counsellors support and what “conversion therapy” bans would criminalize.

<sup>54</sup> **American Psychiatric Association**

Regarding adolescents: “Both of these teams concur that management of those in whom GID [gender identity disorder] has persisted from childhood is more straightforward than management of those in whom GID is of more recent onset. In particular, the latter group is more likely to manifest significant psychopathology in addition to GID. This group should be screened carefully to detect the emergence of the desire for sex reassignment in the context of trauma as well as for any disorder such as schizophrenia, mania or psychotic depression that may produce gender confusion. When present, such psychopathology must be addressed and taken into account prior to assisting the adolescent’s decision as to whether or not to pursue sex reassignment or actually assisting the adolescent with the gender transition.” (p. 764)

<sup>60</sup> An international research review in 2016 claimed these body harming procedures improve psychiatric disorders. “In summary, this review indicates that, although the levels of psychopathology and psychiatric disorders of trans people attending transgender health-care services are higher than the cis [sex accepting] population at the time of assessment, they do improve following gender-confirming medical intervention, in many cases reaching normative values.” (Dhejne et al., 2016) The studies reviewed were not sufficient to warrant the conclusion of mental health improvement, because nearly all the studies were too short to find end point outcomes, only following participants for 3 months to 5 years. The 30-year study by Dhejne et al. (2011, reported above) had found suicide rates increased after 10 years. The studies reviewed in this 2016 report that were longer than 5 years included one 9 year study that had only 22 participants and lost 30% of them to follow-up, leaving a vanishingly small number of participants. The other exception was a 13.3 year study that lost half its participants to follow-up, making it impossible to draw any generalizations about outcomes.

This review does acknowledge, “Overall, it was found that trans people attending transgender health-care services present with a high prevalence of psychiatric disorders and psychopathology.” (p. 52)

<sup>63</sup> Sweden: Karolinska University gender clinic--some quotes:

### **Policy Change Regarding Hormonal Treatment of Minors with Gender Dysphoria at Tema Barn - Astrid Lindgren Children’s Hospital.**

The hormonal treatment of children and adolescents with gender dysphoria may consist of puberty-blocking treatment initiated at the onset of puberty, and cross-sex hormones initiated at the age of 16. These treatments are controversial and have recently become subject to increased attention and scrutiny both nationally and internationally. In December 2019, the SBU (*Swedish Agency for Health Technology Assessment and Assessment of Social Services*) published an overview of the knowledge base which showed a lack of evidence for both the long-term consequences of the treatments, and the reasons for the large influx of patients in recent years. These treatments are potentially fraught with extensive and irreversible adverse consequences such as cardiovascular disease, osteoporosis, infertility, increased cancer risk, and thrombosis. This makes it challenging to assess the risk / benefit for the individual patient, and even more challenging for the minors and their guardians to be in a position of an informed stance regarding these treatments.

#### **Executive Decisions**

- § In light of the above, and based on the precautionary principle, which should always be applied, it has been decided that hormonal treatments (i.e., puberty blocking and cross-sex hormones) will not be initiated in gender dysphoric patients under the age of 16.
- § For patients between ages 16 and 18, it has been decided that treatment may only occur within the clinical trial settings approved by the EPM (*Ethical Review Agency/ Swedish Institutional Review Board*). The patient must receive comprehensive information about potential risks of the treatment, and a careful assessment of the patient’s maturity level must be conducted to determine if the patient is capable of evaluating, and consenting to, the treatment.

§ These changes do not affect the continued psychological and psychiatric care within BUP (Public child and adolescent psychiatry) for patients under 18 years of age.

§ These changes apply from April 1, 2021.

## Oppose “Conversion Therapy” Ban Bill

<sup>64</sup> Finland’s “Recommendation” calls for treating gender dysphoric minors by treating predisposing psychiatric disorders and not resorting to medical interventions.

- Finland’s treatment “Recommendation” said medical gender affirming treatments are not treatments for psychiatric disorders. “Since reduction of psychiatric symptoms cannot be achieved with hormonal and surgical interventions, it is not a valid justification for gender reassignment.” (COHERE, 2020, chapter 6)
- It further said children and adolescents should postpone any body altering interventions until their other disorders are treated first, so it is possible to diagnose whether they still have gender dysphoria, and until their brains mature, preferably to age 25, and they are able to access the consequences of lifelong infertility and health risks. (chapter 6)
- ***In fact, Finland’s treatment “Recommendation” says, “The first-line treatment for gender dysphoria” includes treatment “of possible comorbid disorders” that may “predispose a young person to the onset of gender dysphoria.” (COHERE, 2020, chapter 7) This is exactly what professional change-exploring therapists do and trained pastoral counsellors support and what “conversion therapy” bans would criminalize.***

<sup>70</sup> Children who are given gender affirming puberty blockers or cross sex hormones have greater mental health problems than sex accepting peers, even when they have parent support for gender transition, contrary to claims of two frequently cited studies.

“Together, both articles have been cited over 370 times in the past two or three years. Chen et al. (2018, 76) found the two studies to be the only ones that had yet “explored psychosocial functioning in socially transitioned prepubertal children,” high-lighting the critical importance of the two studies. As noted, Kuvalanka, Gardner, and Munroe (2019, 103) cited the research as “pioneering.” It is clear that the reported results of these two studies have had a huge impact on the field of social science and medicine.” (p. 19)

“Outright errors were made. The issues we have brought up were significant enough to have caught the attention of peer reviewers and been corrected prior to publication; for that matter, the journal editors might have caught at least some of them on their own, prior to peer review.” (p. 21)

“Whereas Olson et al. (2016b) and Durwood, McLaughlin, and Olson (2017) concluded that trans-gender children with strong parental support had, at worst, only slightly higher levels of anxiety with no differences in self-worth or depression; a reanalysis of their findings suggests otherwise, with slightly higher levels of depression but significantly and substantively meaningful differences in anxiety and self-worth, and with results favoring cisgender children, even when the transgender children had high levels of parental support for their gender transitioning.” (p. 21)

Schumm, W. R. & Crawford, D. W. (2019). Is research on transgender children what it seems? Comments on recent research on transgender children with high levels of parental support. *The Linacre Quarterly*, 87(1), 9-24. <https://journals.sagepub.com/doi/10.1177/0024363919884799>

## Oppose “Conversion Therapy” Ban Bill

<sup>75</sup> According to the American Psychological Association and abundant rigorous research internationally, MOST PEOPLE WHO EXPERIENCE SAME-SEX ATTRACTION ALSO EXPERIENCE EQUAL OR GREATER OPPOSITE-SEX ATTRACTION. THEY COMMONLY SHIFT ALONG A SCALE that ranges from exclusively homosexual to mostly homosexual to bisexual (about equally attracted to both sexes) to mostly heterosexual to exclusively heterosexual. They change mostly toward or to exclusively heterosexual. Researchers who are themselves LGB consider a change of 1 or 2 steps along that spectrum to be sexual orientation change. **Even a change of 1 or 2 steps along that spectrum toward less opposite sex attraction or greater opposite-sex attraction may enable someone to live their dream. Shouldn't they have the right to counseling they may need and desire to explore their capacity to make that change? Contemporary change-exploring therapists do not guarantee categorical change from exclusively homosexual attraction to exclusively heterosexual attraction. A partial change can change a life.**

“Hence, directly contrary to the conventional wisdom that individuals with exclusive same-sex attractions represent the prototypical ‘type’ of sexual-minority individual, and that those with bisexual patterns of attraction are infrequent exceptions, the opposite is true. Individuals with nonexclusive patterns of attraction are indisputably the ‘norm,’ and those with exclusive same-sex attractions are the exception.” This pattern has been found internationally.

Diamond, L. (2014). Chapter 20: Gender and same-sex sexuality. In Tolman, D., & Diamond, L., Co-Editors-in-Chief (2014). *APA Handbook of Sexuality and Psychology, Volume 1. Person Based Approaches*. Washington D.C.: American Psychological Association. P. 633. <https://content.apa.org/PsycBOOKS/toc/14193>

“The largest identity group, second only to heterosexual, was 'mostly heterosexual' for each sex and across both age groups, and that group was 'larger than all the other non-heterosexual identities combined’” (abstract). “The bisexual category was the most unstable” with three quarters changing that status *in 6 years* (abstract). “[O]ver time, more bisexual and mostly heterosexual identified young adults of both sexes moved toward heterosexuality than toward homosexuality” (p 106).

Savin-Williams, R., Joyner, K., & Rieger, R. (2012). Prevalence and stability of self-reported sexual orientation identity during young adulthood. *Archives of Sexual Behavior* 41, abstract, p. 106. <https://link.springer.com/article/10.1007/s10508-012-9913-y>; reviewed in Diamond & Rosky (2016), p. 7, Table 1; Diamond (2014), in *APA Handbook, vol. 1*, p. 638. Mostly heterosexual individuals generally do not identify as LGB and can get overlooked by research or popular surveys.

## Oppose “Conversion Therapy” Ban Bill

---

<sup>76</sup> Many same sex attracted individuals are in opposite sex relationships.

In the US, a nationally representative study found that, of bisexual men and women who were in any relationship, the vast majority were in an opposite sex relationship (88% of bisexual men and 90% of bisexual women), most of them married. (Herek et al., 2010, Table 8; p. 194.)

Herek, G.M., Norton, A.T., Allen, T.J., & Sims, C.L. (2010). Demographic, psychological, and social characteristics of self-identified lesbian, gay, and bisexual adults in a US probability sample. *Sexuality Research Social Policy*, 7, 176–200. <https://link.springer.com/content/pdf/10.1007%2Fs13178-010-0017-y.pdf>

In the U.K. in 2017, approximately 17% of LGB identified individuals were married, 12% to the opposite sex and 5% to the same sex. Therefore, more than two-thirds of married LGB identified people, or 71%, were married to the opposite sex.

Lifetime, 31% of LGB identified people had ever been married or in a civil union (reported as 69% had never been).
